

The NotifyLink Hosted Edition for

Today, small-to-medium businesses (SMBs) need an effective way to provide their increasingly mobile workforce secure wireless access and management of their email. As they source a solution, they are faced with a variety of challenges including differentiating the benefits between wireless carriers, wireless devices, and whether to source an "on premise solution" or a "Hosted Solution" to meet their mobility needs.

An on premise solution will require IT resources in the form of initial hardware procurement, long-term server management, ongoing time allocated to install, evaluate, place a solution into production, manage the solution, and support internal end-users. In many cases, SMBs are pressed for an immediate mobility solution but do not have the personnel or financial resources to deploy an on premise solution.

The alternative: NotifyLink Hosted Edition for MDAemon®.

The NotifyLink Hosted Edition provides MDAemon administrators with a simple, fast, and cost effective solution to their immediate mobility needs. The service will seamlessly integrate into an existing network while offering the broadest possible wireless device support and feature functionality of any solution on the market today. The NotifyLink Hosted Edition provides Over-the-Air synchronization of email thus freeing users from being required to cradle their wireless devices in order to maintain synchronization. It provides mobile users with secure real-time, wired and wireless synchronization of their email supporting virtually all-wireless PalmOS, Windows Mobile, and BlackBerry devices.

Most SMBs require a single solution that will offer them support for a variety of wireless devices and networks. Providing a network independent solution enables organizations a level of flexibility to change devices or networks as technology evolves and improves. Many companies have expanded their requirements for wireless solutions to include both mobile wireless for voice and data networks as well as fixed wireless supporting all versions of 802.11x networks.

Unlike any other product, the NotifyLink Hosted Edition for MDAemon provides a single solution supporting virtually all wired Palm and Pocket PC devices and all wireless PalmOS, Windows Mobile, and RIM/Blackberry devices

simultaneously over a variety of wireless networks: GSM/GPRS, CDMA/1XRTT, iDEN and 802.11x. The NotifyLink Hosted Edition for MDAemon provides "PUSH" notification, eliminating the need for users to manually initiate a data session in order to retrieve their personal data. With this service, all email information will be stored on the NotifyLink Hosted Server using AES encryption while all delivery of information to and from the wireless devices to the NotifyLink Hosted Edition is encrypted utilizing the FIPS 140-2 compliant TDES or AES encryption algorithms.

Product Overview

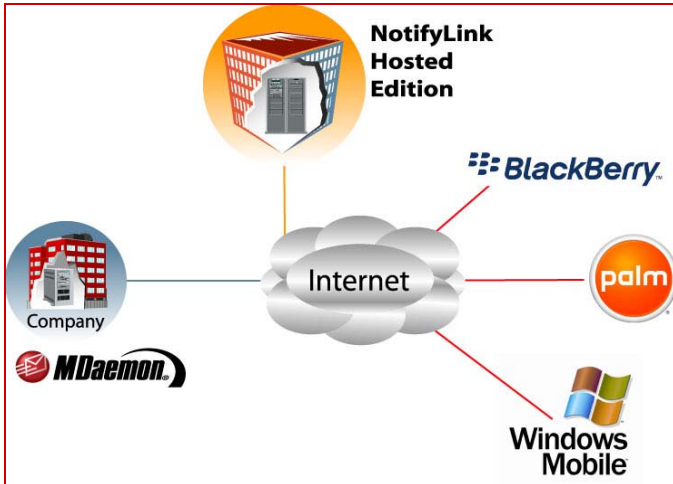

The NotifyLink Hosted Edition for MDAemon is based on a client-server architecture comprised of the NotifyLink Hosted Enterprise server and the NotifyLink platform specific device clients.

This service is ideal for companies whose employees include mobile professionals who need real-time "automatic" synchronization of their existing email to a variety of supported mobile devices. With the NotifyLink Hosted Edition, mobile users have the ability to read, compose, reply, forward, mark as read, and delete email messages from their mobile device.

Email Reconciliation

When using the NotifyLink Hosted Edition for MDAemon, emails will be synchronized to a user's mobile device. Any email forwarded to the mobile device must meet any filter criteria specified by either the individual user or various policies established by the IT administrator. All email originated from the mobile device will be synchronized with the user's desktop "Sent" file. A copy of all items sent from the device will be maintained within your organizations mail server. If a user deletes an email on the mobile device, NotifyLink can automatically place that email in the "Trash" folder on the users desktop. Users may also specify that upon reading an email on their mobile device, the status of "Read" will be updated back at their desktop.

The NotifyLink Hosted Edition for

of Blackberry phone devices. In addition, the NotifyLink Hosted Edition provides user configurable attachment support regarding information about the number of attachments, names of the attachments, and sizes of the attachments. This information is made available as part of the email displayed on the mobile device. The NotifyLink Hosted Edition also gives users the ability to forward an attachment to any other email user.

Security

For data encryption from the NotifyLink Hosted Server to the wired or wireless device, the NotifyLink Hosted Edition supports both Triple DES and the latest Advanced Encryption Standard (AES) encryption algorithms.

For mobile device to NotifyLink Hosted Server authentication, The NotifyLink Hosted Edition supports AES authentication.

For data encryption from the NotifyLink Hosted Server to the customer's email platform, the NotifyLink Hosted Edition supports SSL connectivity.

Message Filtering

The NotifyLink Hosted Edition supports a robust set of filters that are controlled by the mobile end-user. Filters can be set based upon keyword searches in the subject, sender, and body of each email, recipient type, sender, or any combination of the aforementioned.

Attachment Support

The NotifyLink Hosted Edition supports native attachment download and upload for Windows Mobile and PalmOS wireless devices as well as attachment support for a variety

User Benefits

- Compose, Reply, Delete and Forward from Wireless Device
- Attachment Support on Palm, Windows Mobile and Blackberry
- "Push" Notification with Real-Time Synchronization
- Does Not Require "Always-On" Desktop Computer
- Enable or Disable Email Synchronization From Your Wireless Device
- Supports a Variety of Wireless Carriers and Networks

IT Benefits

- Quick and Simple Solution for Mobility
- Hosted Solution
- No Additional Hardware or Server Software
- Guaranteed 99.5 Service Availability
- Uses AES or Triple DES Encryption Standards
- Hosted Access Through Specific IP Address

Supported Devices

- Blackberry Phones (OSV 3.6 and higher)
- Treo (6XX, Treo P, Treo W) (OS 4.0 and higher)
- Windows Mobile Pocket PC (Windows Mobile 5.0)
- Windows Mobile PPC Phone Edition (Windows Mobile 5.0)
- Windows Mobile Smartphone (Windows Mobile 5.0)

Alt-N Technologies

- Requires MDaemon® 6.0 or higher

User Requirements

- Select Wireless PDA
- Load NotifyLink Client for Supported Mobile Device
- Obtain NotifyLink Product Key
- Register Wireless PDA Over-the-Air
- Access NotifyLink Web Client for Managing Individual Configuration Options
